

Assigning a Serial Number to a Variable Field

- This example demonstrates how to create a serial number file and assign it to a field on your label.
- We begin by double clicking on the field that we wish to be serialized.
- In the datasource dialog, we choose 'serial number'
- At this point, we can choose a file that already exists, or create a new one.
- In this example we will create a new file.
- In the dialog provided, give the file a name and optionally, a description.
- Next, make sure the length value corresponds to the length of your field. In this case, 15.
- Now give it a starting value. Be sure to make it 15 digits.
- A serial file always remembers the last number printed and can be shared by many different label formats. Serial numbers never repeat. If you do not want to remember the last number printed, try the Increment datasource instead.
